

# BLYNK APP: ADD DISPLAY

Step 1/5

- [Getting-started tutorial](#) (use Blynk via USB cable)
- Get Blynk App (search Play Store)
- Start project (device: Arduino Nano, connection type USB)
- Add a display

Learn more: [docs.blynk.cc/#widgets-displays-lcd](https://docs.blynk.cc/#widgets-displays-lcd)

# BLYNK: USB CONNECTION

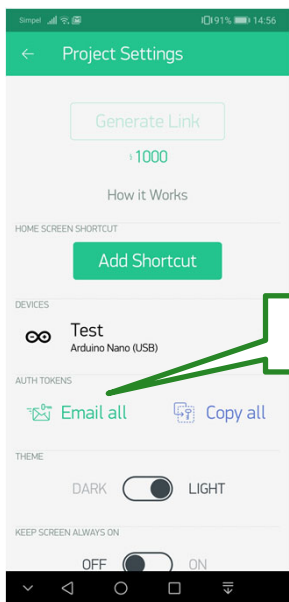

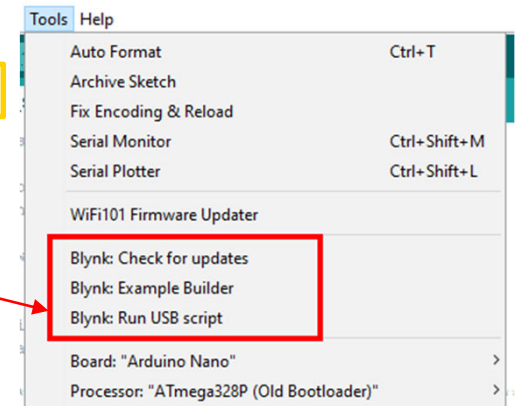

(NO WIFI)

## Step 2/5

- Start with *File > Examples > Blynk > Boards\_USB\_Serial > Arduino\_Serial\_USB*
- Check Blynk-entries in tools menu: if not there, copy Arduino\tools folder from AppDev zip-file to Documents\Arduino and restart Arduino IDE
- Fill in Auth Token:

Save As ...

Get Auth Token

```
34 #include <BlynkSimpleStream.h>
35
36 // You should get Auth Token in the Blynk App.
37 // Go to the Project Settings (nut icon).
38 char auth[] = "cbcbd4b13f8d4135a930a91f0881d7be";
```

Go to project settings

UNIVER

# BLYNK: PRINT TO DISPLAY

## CONNECTION VIA USB

Step 3/5

Learn more: [docs.blynk.cc/#widgets-displays-lcd](https://docs.blynk.cc/#widgets-displays-lcd)

- Add code to sketch for Blynk LCD widget:

at top:

```
WidgetLCD lcd(V1); // this is a display widget in the Blynk Userinterface
```

at end of setup():

```
lcd.clear(); // clear the display in the Blynk App  
lcd.print(0,0, "Hello Blynk");
```

- Close Blynk tool
- Upload sketch
- Run *Tools > Blynk: Run USB script:*

```
Blynk  
Ensure that Serial Monitor and Plotter are closed when using this tool.  
It uses same port and speed as Serial Monitor  
  
Connecting device at COM5 to blynk-cloud.com:80...  
OpenC0C("\\.\COM5", baud=9600, data=8, parity=no, stop=1) - OK  
Connect("blynk-cloud.com", "80") - OK  
InOut() START  
DSR is OFF
```

```
Blynk  
Ensure that Serial Monitor and Plotter are closed when using this tool.  
It uses same port and speed as Serial Monitor  
  
Connecting device at COM5 to blynk-cloud.com:80...  
OpenC0C("\\.\COM5", baud=9600, data=8, parity=no, stop=1) - OK  
Connect("blynk-cloud.com", "80") - OK  
InOut() START  
DSR is OFF
```

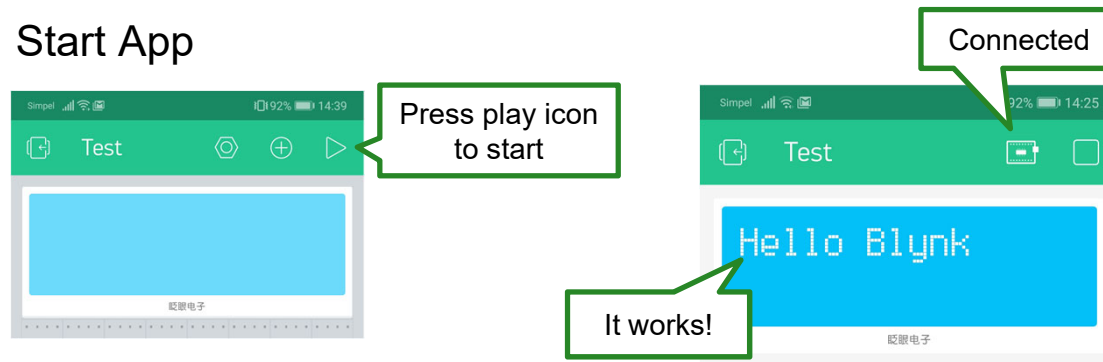

# BLYNK: USB CONNECTION

(NO WIFI)

Step 4/5

- Start App

UNIVERSITY OF TWENTE.

# BLYNK: ADD SENSOR CODE

## CONNECTION VIA USB

Step 5/5

Learn more: [docs.blynk.cc/#widgets-displays-lcd](https://docs.blynk.cc/#widgets-displays-lcd)

- Use code from example "DHT\_Unified\_Sensor"

at top:

```
#include <Adafruit_Sensor.h>
#include <DHT.h>
#include <DHT_U.h>

#define DHTPIN 2 // Pin which is connected to the DHT sensor
#define DHTTYPE DHT11

DHT_Unified dht(DHTPIN, DHTTYPE);
```

in setup():\*

```
// Initialize sensor
dht.begin();
```

\* Remove "Hello Blynk" print-statement from setup()

in loop(): after Blynk.run(); add:

```
// Get temperature event and print its value
sensors_event_t event;
dht.temperature().getEvent(&event);
if (isnan(event.temperature)) {
  Serial.println("Error reading temperature!");
}
else {
  lcd.print(0,0,"Temp: ");
  lcd.print(10,0,event.temperature);
}
delay(5000); // delay 5 seconds
```

... repeat for humidity

25 °C

[Display temperature as a nice labeled value?](#)

Run sketch:

- Close Blynk USB Script window
- Upload sketch 
- Run *Tools* > *Blynk: Run USB script*
- Check Blynk App

# BLYNK: WARNING

## USE EVENTOR AND NOTIFICATION WIDGET

- Add Eventor and Notification widget,
- Configure Eventor:

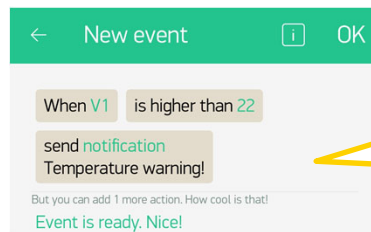

Learn more:

[docs.blynk.cc/#widgets-other-eventor](https://docs.blynk.cc/#widgets-other-eventor)

[docs.blynk.cc/#widgets-notifications-push-notifications](https://docs.blynk.cc/#widgets-notifications-push-notifications)

Eventor

Drawback: generates lots of events... might be better to do via code, and add a limit

- Add code:

```
// send temperature to Virtual Pin 1 in the App,
// to be able to process it in the Eventor:
Blynk.virtualWrite(V1, event.temperature);
```

Alternative: send notification from code in Arduino sketch:

```
if (event.temperature>24) Blynk.notify("Temperature warning");
```
